LASER HAIR REMOVAL

Are you tired of shaving, using creams, plucking and waxing? There is an alternative.

How does it work?

Using a flash of laser light, the hair follicle is heated up to a point of destruction and the skin is only warmed. The ability to target the hair and spare the skin is termed TKS – Thermokinetic Selectivity. A chiller is used to prevent super heating of the skin. This minimizes side effects and increases patient comfort.

Interested? (check areas of interest)

- upper lip cheeks chin
- eyebrows hairline bikini line
- legs arms underarms
- chest hairline back

What is your skin type? (check one)

- always burns – never tans always burns – tans with difficulty
- sometimes burns – tans average rarely burns – tans with ease
- moderately pigmented black

What would you like to do? (check one)

- I would like to talk to someone about the procedure.
- I am not interested at this time.
